

# Title: "Data Analytics Project- [Public health awareness]"

**NAME: S.BOOBALAN    REG NO : 620521104303**

**COLLEGE CODE:6205.    EMAIL : boobalansaravanan0810@gmail.com**

## Overview of the project

In this document, we present the findings and insights from our Data Analytics project, titled "[Public health awareness]." This project focuses on data cleaning, transformation, and statistical analysis to derive meaningful insights from raw data. Our objective is to provide a comprehensive framework for understanding the process, methodologies, and outcomes of this analytics endeavor.

## Data collection

We begin by discussing the various data sources used for this project, the methods employed to acquire the data, and the preprocessing steps implemented to ensure data quality. This section provides a clear understanding of how we prepared the data for analysis.

Data can be acquired by various methods such as online surveying, interviews, online form data, data repos and scraping techniques. We have used the data that is already available in the Kaggle dataset.

Data set : <https://www.kaggle.com/datasets/osmi/mental-health-in-tech-survey>.

## Data cleaning

To analyze the whole dataset, we first have to clean the data set. We used Kaggle to do this stuff so Kaggle is compatible with various operations and I have some familiarity with Kaggle.

Code:

```
#imports necessary libraries to do basic things on the dataset
import pandas as pd
import numpy as np
import seaborn as sns
import matplotlib.pyplot as plt

print('Successfully imported')
```

## Read Dataset

```
#Reading data
data = pd.read_csv('/kaggle/input/mental-health-in-tech-survey/survey.csv')
data.head()
```

|   | Timestamp           | Age | Gender | Country        | state | self_employed | family_history | treatment | work_interfere |
|---|---------------------|-----|--------|----------------|-------|---------------|----------------|-----------|----------------|

So far we have finished the data cleaning and preprocessing phase now let's jump into our main agenda in this analysis

## Audience reach

To measure audience reach, we are going to analyze the distribution of respondents by country and state. Visualize this using maps or bar charts.

## Code:

```
# Count the number of respondents per country
country_counts = data['Country'].value_counts()

# Create a bar chart with country names on the x-axis
plt.figure(figsize=(12, 6))
plt.bar(country_counts.index, country_counts.values)
plt.xlabel("Country")
plt.ylabel("Number of Respondents")
plt.title("Audience Reach by Country")

# Set the x-tick labels to be country names
plt.xticks(country_counts.index, rotation=90)

plt.show()
```

```
awareness_columns = ["wellness_program", "seek_help", "anonymity", "mental_health_consequence"]

awareness_counts = {}
total_respondents = len(data)

for column in awareness_columns:
    counts = data[column].value_counts()
    awareness_counts[column] = counts / total_respondents * 100

awareness_df = pd.DataFrame(awareness_counts)
```

```
fig, axes = plt.subplots(nrows=2, ncols=2, figsize=(12, 8))

for i, column in enumerate(awareness_columns):
    ax = axes[i // 2, i % 2]
    awareness_df[column].plot(kind="bar", ax=ax)
    ax.set_title(f"Awareness of {column}")
    ax.set_ylabel("Percentage")
    ax.set_xlabel("Response")

plt.tight_layout()
plt.show()
```

```
# Create a subset of relevant columns
columns_of_interest = ["wellness_program", "seek_help", "anonymity", "treatment"]
subset_data = data[columns_of_interest]

# Replace missing values (if any) with a default value (e.g., "Not Specified")
subset_data.fillna("Not Specified", inplace=True)

# Create a contingency table to calculate percentages
contingency_table = pd.crosstab(subset_data["treatment"], subset_data["wellness_program"], normalize="index")

# Visualize the impact of wellness_program on treatment-seeking
plt.figure(figsize=(10, 6))
sns.heatmap(contingency_table, annot=True, cmap="YlGnBu")
plt.title("Impact of Wellness Program on Treatment Seeking")
plt.xlabel("Wellness Program")
plt.ylabel("Treatment")
plt.show()
```

## **Conclusion**

In conclusion, we provide a comprehensive recap of the project's objectives and the accomplishments achieved. We discuss lessons learned, challenges encountered, and the overall significance of the project in the context of data analytics.
